Risk measures (%) ¹⁰	10 years gross/net	Lifetime gross/net
Standard deviation	-/-	6.87/-
Sharpe ratio	-/-	0.55/0.09
Upside capture ratio	-/-	39.54/32.27
Downside capture ratio	-/-	40.97/46.74

Credit quality summary (%)

U.S. Treasuries/Agencies	23.30
AAA/Aaa	32.22
AA/Aa	3.91
A	12.67
BBB/Baa	12.90
BB/Ba	8.29
B	3.70
CCC & Below	1.25
Unrated	1.75

Weighted average expense ratio (%)

Bond ratings are based on a model portfolio's underlying funds' holdings and investment policies. Bond ratings, which typically range from AAA/Aaa (highest) to D (lowest), are assigned by credit rating agencies such as Standard & Poor's, Moody's and/or Fitch, as an indication of an issuer's creditworthiness. For most American Funds and Capital Group ETFs, if agency ratings differ, a security will be considered to have received the highest of those ratings; and securities in the Unrated category have not been rated by a rating agency, however, the investment adviser performs its own credit analysis and assigns comparable ratings that are used for compliance with applicable investment policies. Please see each fund's most recent prospectus for details.

Important disclosures

Model portfolios are subject to the risks associated with the underlying funds in the model portfolio. Investors should carefully consider investment objectives, risks, fees and expenses of the funds in the model portfolio, which are contained in the fund prospectuses.

Investing outside the United States involves risks, such as currency fluctuations, periods of illiquidity and price volatility. These risks may be heightened in connection with investments in developing countries.

The use of derivatives involves a variety of risks, which may be different from, or greater than, the risks associated with investing in traditional securities, such as stocks and bonds.

Lower rated bonds are subject to greater fluctuations in value and risk of loss of income and principal than higher rated bonds.

The return of principal for bond portfolios and for portfolios with significant underlying bond holdings is not guaranteed. Investments are subject to the same interest rate, inflation and credit risks associated with the underlying bond holdings.

Nondiversified funds have the ability to invest a larger percentage of assets in the securities of a smaller number of issuers than a diversified fund. As a result, poor results by a single issuer could adversely affect fund results more than if the fund invested in a larger number of issuers. See the applicable prospectus for details.

Smaller company stocks entail additional risks, and they can fluctuate in price more than larger company stocks.

There have been periods when the results lagged the index(es) and/or average(s). The indexes are unmanaged and, therefore, have no expenses. Investors cannot invest directly in an index. Index/Index blends for Capital Group/American Funds Model Portfolios are those that the Portfolio Solutions Committee believes most closely approximate the investment universe of a given model portfolio. The index/index blends do not specifically represent the benchmarks of the underlying funds in the American Funds model portfolio.

Portfolios are managed, so holdings will change. Holdings are weighted averages of the underlying funds. Certain fixed income and/or cash and equivalents holdings may be held through mutual funds managed by the investment adviser or its affiliates that are not offered to the public.

Totals may not reconcile due to rounding.

Investment results assume all distributions are reinvested and reflect applicable fees and expenses.

Results and results-based figures shown are preliminary and subject to change.

1. Accrued income and the timing of its settlement, as well as classification of convertible bonds as debt or equity, can cause slight variations in the balances displayed in different portfolio composition breakdowns.
2. Includes cash, short-term securities, other assets less liabilities, accruals, derivatives and forwards. It may also include investments in money market or similar funds managed by the investment adviser or its affiliates that are not offered to the public.
3. Risk of loss is defined by the Portfolio Solutions Committee as an increased exposure to equities, which can lead to greater volatility in the portfolio and potentially impact both withdrawal rates and whether overall assets invested will decline over time.
4. When applicable, returns for less than one year are not annualized, but calculated as cumulative total returns.
5. Composite gross results are net of underlying fund fees and expenses of all of the accounts in the composite and gross of any advisory fees charged by model providers. Results would have been lower if such fees had been deducted.
6. YTD (year-to-date return): For the period from January 1 of the current year to the date shown or from inception date if first offered after January 1 of the current year.
7. Returns are in USD, are asset weighted, and reflect the reinvestment of dividends, interest and other earnings (net of withholding taxes).
8. Composite net results are calculated by subtracting an annual 3% fee, (which is equal to or higher than the highest actual model portfolio wrap fee charged by a program sponsor) from the gross composite monthly returns, which are net of underlying fund fees and expenses of all of the accounts in the composite.
9. Lifetime results are since the inception date of the portfolio.
10. Risk measures net of fees are based on net composite results which are calculated using an annual fee equivalent to 3% deducted from the gross results, which do not reflect the deduction of fees and expenses.
11. Expense ratio for the model is the weighted average of the underlying mutual funds' and/or exchange-traded funds' gross expense ratios as of their most recent prospectuses. Underlying mutual funds are based on Class F-3 shares. Expense ratios do not reflect any advisory fee charged by model providers.
12. Source: Lipper. Expense ratio is the weighted average of the underlying funds' Lipper category averages, as of the most recent fiscal year-ends, available as of 09/30/2024. Expense ratio comparisons for models excluding ETFs are based on institutional load funds (and no funds of funds) for the mutual funds; for models including ETFs, expense ratio comparisons are based on institutional load funds (and no funds of funds) for the mutual funds and based on ETFs for the ETFs.

Model portfolios are provided to financial intermediaries who may or may not recommend them to clients. The portfolios consist of an allocation of funds for investors to consider and are not intended to be investment recommendations. The portfolios are asset allocations designed for individuals with different time horizons, investment objectives, and risk profiles. Allocations may change and may not achieve investment objectives. If a cash allocation is not reflected in a model, the intermediary may choose to add one. Capital Group does not have investment discretion or authority over investment allocations in client accounts. Rebalancing approaches may differ depending on where the account is held. Investors should talk to their financial professional for information on other investment alternatives that may be available. In making investment decisions, investors should consider their other assets, income, and investments. Visit capitalgroup.com for current allocations.

This content, developed by Capital Group, home of American Funds, should not be used as a primary basis for investment decisions and is not intended to serve as impartial investment or fiduciary advice.

Glossary

Capture Ratio Downside – Ratio of a fund/model/composite's return during periods when the index was down, divided by the return of the index during those periods. For example, during periods when the index was down, a down-capture ratio greater than 100 indicates the fund/model/composite produced a lower return than the index.

Standard Deviation – Annualized standard deviation (based on monthly returns) is a common measure of absolute volatility that tells how returns over time have varied from the mean. A lower number signifies lower volatility.

Sharpe Ratio – Sharpe ratios use standard deviation and excess return to determine reward per unit of risk. The higher the number, the better the portfolio's historical risk-adjusted performance.

Capture Ratio Upside – Ratio of a fund/model/composite's return during periods when the index was up, divided by the return of the index during those periods. For example, an up-capture ratio greater than 100 indicates the fund/model/composite produced a higher return than the index during periods when the index was up.

S&P Target Date Retirement Income Index – The S&P Target Date Retirement Income Index, a component of the S&P Target Date Index Series, has an asset allocation and glide path that represent a market consensus across the universe of target date fund managers. The index is fully investable, with varying levels of exposure to the asset classes determined during an annual survey process of target date funds' holdings. This index is unmanaged, and its results include reinvested dividends and/or distributions but do not reflect the effect of sales charges, commissions, account fees, expenses or U.S. federal income taxes.
